

302 HATCH ACTUATOR WIRING

Before beginning installation, disconnect the battery to avoid any accidental contact with "live" wires. Use 10-12 gauge wire to the dash to minimize voltage drop to the actuator. To increase the performance and longevity of your actuator, we strongly recommend the use of Eddie Marine #302-33 Forward-Reverse Relay box. This will insure that the actuator has adequate voltage at all times. When finished, securely fasten all wiring to prevent loosening of the connections.
